Academic Year: 2026–2027
Naan Mudhalvan – ServiceNow / IT Service Management

CERTIFICATE

This is to certify that the project report entitled “ServiceNow Administrator Streamlining IT Procurement: Auto Ticket Classification using FLOW DESIGNER” is a bonafide work carried out by the above students during the academic year 2026–2027 as part of the Naan Mudhalvan training/project work.

The work focuses on automating ticket classification and routing in ServiceNow using Flow Designer. The project demonstrates how flow logic can evaluate ticket information and apply appropriate classification, assignment, and notification actions.

The project work has been completed under the guidance of the concerned faculty/trainer and is submitted for academic evaluation.

Faculty / Trainer Signature _____

Head of Department: B.Sc Computer Science _____

DECLARATION

I hereby declare that the project report entitled “ServiceNow Administrator Streamlining IT Procurement: Auto Ticket Classification using FLOW DESIGNER” is prepared by us as part of the Naan Mudhalvan training/project activity. The report presents the project concept, requirement analysis, design, implementation approach, testing procedure, documentation, and demonstration flow for automated ticket classification in ServiceNow.

We have used the learning resources and documentation required to understand ServiceNow Flow Designer and ticket management. Wherever external technical documentation has been consulted, it is acknowledged in the References section.

Place: _____

Date: _____

Signature: _____

ACKNOWLEDGEMENT

We sincerely thank our college management and faculty members for providing the opportunity to participate in the Naan Mudhalvan training programme. We are grateful to the trainers and mentors who provided guidance on ServiceNow, IT Service Management, Flow Designer, automation, and ticket handling.

We also thank our department for providing the required academic support to complete this project report. Finally, we thank everyone who supported us directly or indirectly during the preparation, configuration, testing, and documentation of this project.

1. BRAINSTORMING & IDEATION PHASE

1.1 Project Overview

The project is designed to automate the classification of service tickets in ServiceNow. The main idea is to reduce repetitive manual classification by using a Flow Designer workflow that evaluates ticket information and performs predefined actions.

1.2 Problem Identification

When tickets are created, manual classification and routing can take time and may result in inconsistent assignment. Tickets may need to be categorized, prioritized, assigned to a suitable group, and communicated to users.

1.3 Proposed Idea

The proposed solution is to create a Flow Designer flow that starts when a ticket is created or updated, checks relevant ticket fields, determines the appropriate classification, and performs configured actions such as setting category/subcategory, assignment group, priority, or notification.

1.4 Objectives

• Automate ticket classification using Flow Designer.
• Reduce repetitive manual classification work.
• Apply consistent rules to incoming tickets.
• Route tickets to the appropriate assignment group.
• Improve ticket handling and response consistency.
• Test the flow under different ticket conditions.

1.5 Expected Outcome

The expected outcome is a ServiceNow ticket process in which predefined conditions automatically classify and route tickets. The flow should provide predictable behaviour and reduce unnecessary manual updates.

2. REQUIREMENT ANALYSIS PHASE

2.1 Functional Requirements

• The system shall detect a newly created or updated ticket.
• The flow shall evaluate selected ticket information.
• The flow shall classify tickets according to configured conditions.
• Relevant fields shall be updated based on the classification.
• Tickets shall be routed to the configured assignment group where required.
• Notifications may be generated for defined conditions.
• Each classification rule shall be tested with matching and non-matching conditions.

2.2 Non-Functional Requirements

The flow should be understandable, maintainable, consistent, and easy to demonstrate. Conditions and actions should have meaningful names, and unnecessary automation steps should be avoided.

2.3 User Requirements

Users need a ticket process that reduces manual classification and routes requests consistently. The resulting ticket should contain the expected classification and assignment information.

2.4 Technical Requirements

• ServiceNow instance with access to Flow Designer.
• Incident or ticket table and form.
• Flow Designer configuration access.
• Appropriate fields for classification and assignment.
• Browser for accessing the ServiceNow interface.
• Test records or controlled ticket conditions.

2.5 Requirement Traceability

Ticket classification requirements are associated with Flow Designer conditions and actions. Testing verifies that each rule produces the expected classification and routing result.

3. PROJECT DESIGN PHASE

3.1 Design Approach

The design separates the project into trigger conditions, ticket classification logic, actions, routing, and testing. This makes it easier to identify which part of the flow is responsible for each behaviour.

3.2 Ticket Flow Design

The ticket record provides the input to the flow. The selected ticket fields are evaluated against configured conditions. Based on the matching condition, the flow performs the corresponding classification and routing actions.

3.3 Flow Designer Design

The Flow Designer flow is designed with a trigger, condition checks, decision branches, and actions. The flow should use clear names and should perform only the required automation for the project.

3.4 Logical Flow

Ticket created/updated → Flow is triggered → Ticket information is evaluated → Classification condition is matched → Classification fields are updated → Assignment/routing action is performed → Optional notification → Result is verified.

3.5 Design Principles

• Keep each classification rule focused on a clear purpose.
• Use meaningful names for flows, conditions, and actions.
• Avoid unnecessary flow steps.
• Keep classification and routing rules consistent.
• Test both matching and non-matching conditions.

4. PROJECT PLANNING PHASE

4.1 Work Breakdown

Phase 1: Understand the project idea and identify the ticket classification problem.
Phase 2: List functional, non-functional, user, and technical requirements.
Phase 3: Design the trigger, conditions, classification logic, and actions.
Phase 4: Prepare implementation and testing sequence.
Phase 5: Configure and implement the Flow Designer flow.
Phase 6: Execute test cases and record expected/actual behaviour.
Phase 7: Prepare report, screenshots, configuration details, and references.
Phase 8: Demonstrate the completed automation.

4.2 Implementation Schedule

The implementation is planned in small steps so that each flow component can be tested before moving to the next. First, the ticket fields and classification rules are identified. Next, the trigger, conditions, and actions are configured. After each major rule is created, the flow is tested with relevant ticket data. Finally, the complete automation is demonstrated and documented.

4.3 Risk Considerations

Possible implementation issues include incorrect field names, conditions that do not match the intended ticket state, conflicting automation, incorrect assignment actions, and testing only one classification path. These risks are reduced by using clear names, testing multiple conditions, and reviewing flow execution results.

5. PROJECT DEVELOPMENT PHASE

5.1 Development Environment

The project is implemented in a ServiceNow environment using Flow Designer and a suitable ticket/Incident table. The browser is used to configure the flow and verify the resulting ticket behaviour.

5.2 Flow Trigger

The flow begins when the configured ticket event occurs, such as creation or an appropriate update. The trigger provides the record information required by subsequent flow steps.

5.3 Classification Logic

The flow evaluates selected ticket fields using conditions or decision logic. Depending on the matching condition, the flow identifies the required classification and performs the configured updates.

5.4 Actions

Actions can update ticket fields, set assignment information, route the ticket, or perform other configured automation. Each action should correspond to a defined project requirement.

5.5 Implementation Sequence

1. Open Flow Designer in the ServiceNow instance.
2. Identify the required ticket fields and classification rules.
3. Create the flow and configure the appropriate trigger.
4. Add conditions/decision branches for ticket classification.
5. Configure field updates and assignment/routing actions.
6. Save and activate the flow.
7. Create test tickets and observe the flow execution.
8. Modify ticket conditions and verify alternate classification paths.

5.6 Implementation Result

The completed configuration provides an automated ticket classification process where the configured Flow Designer rules respond to ticket information and perform the required classification and routing actions.

6. PROJECT TESTING PHASE

6.1 Testing Objective

Testing verifies that the Flow Designer flow behaves according to the requirements. The test process checks classification conditions, resulting field updates, routing, and non-matching conditions.

6.2 Test Cases

Test Case	Expected Result	Status
TC01 – Create ticket	Flow triggers successfully	Pass / To be recorded
TC02 – Classification condition matches	Correct classification is applied	Pass / To be recorded
TC03 – Assignment condition matches	Correct assignment group is applied	Pass / To be recorded
TC04 – Non-matching condition	Default/alternate path is followed	Pass / To be recorded
TC05 – Multiple ticket fields	Flow evaluates configured conditions correctly	Pass / To be recorded
TC06 – Valid ticket	Ticket is processed without unwanted error	Pass / To be recorded
TC07 – Repeated tests	Rules remain stable across test records	Pass / To be recorded

6.3 Testing Result

Testing should be completed in the actual ServiceNow instance before final submission. The final report should use the real observed results and screenshots from the implemented flow.

6.4 Defect Handling

If a flow does not behave as expected, the trigger, conditions, field references, actions, and execution details should be checked. After correction, the same test case should be executed again to confirm the change.

7. PROJECT DOCUMENTATION PHASE

7.1 Purpose of Documentation

Documentation records the project objective, requirements, design, implementation, testing, and final automation behaviour. It also makes the configuration easier to understand and reproduce.

7.2 Flow Documentation

The flow should be documented with its name, table, trigger, conditions, actions, classification logic, assignment behaviour, and expected result.

7.3 Flow Documentation Format

Flow Name: Auto Ticket Classification
Table: Incident / Ticket
Trigger: Ticket created or configured update event
Conditions: Configured ticket classification conditions
Actions: Classification and assignment/routing updates
Expected Result: Ticket is classified and routed automatically

7.4 Screenshot Documentation

Screenshots should be taken from the completed ServiceNow configuration. Suitable screenshots include the Flow Designer flow, trigger configuration, conditions/decision branches, action configuration, sample ticket before automation, and the final classified/routed ticket.

7.5 References

ServiceNow learning material and documentation used during the Naan Mudhalvan ServiceNow training should be listed here. Only resources actually consulted for the implementation should be included.

8. PROJECT DEMONSTRATION PHASE

8.1 Demonstration Objective

The demonstration presents the completed automated ticket classification process from start to finish. It should show the project name, Flow Designer configuration, ticket creation, classification decision, resulting field updates, and routing outcome.

8.2 Demonstration Flow

1. Introduce the project title: Auto Ticket Classification using Flow Designer.
2. Open Flow Designer in ServiceNow.
3. Show the configured flow and trigger.
4. Show the classification conditions/decision branches.
5. Create or open a test ticket.
6. Enter the ticket information used by the classification rule.
7. Run/observe the flow execution.
8. Show the resulting category/classification and assignment.
9. Demonstrate an alternate condition where applicable.
10. Summarize the final result.

8.3 Demonstration Evidence

The final evidence should be based on the actual project instance. Screenshots and the demonstration recording should show the implemented flow and its visible ticket result. The project name should be clearly stated during the demonstration.

8.4 Final Outcome

The project demonstrates practical understanding of ServiceNow Flow Designer and automated ticket processing. The completed work shows how configured flow logic can classify and route tickets consistently.

CONCLUSION

The “Auto Ticket Classification using Flow Designer” project provides a practical implementation of workflow automation in ServiceNow. The project is organized through eight phases beginning with brainstorming and requirement analysis, followed by design and planning, development, testing, documentation, and demonstration.

The implementation focuses on automating ticket classification and routing using Flow Designer conditions and actions. It provides an organized method for reducing repetitive manual classification and improving consistency in ticket handling.

Actual ServiceNow screenshots, observed test results, and demonstration evidence should be inserted after the implementation is completed in the user's instance.
